The most pressing questions are: How do you define academic freedom, and why does it matter? How does this matter for progressive change? If there is no definition of academic freedom, how can we measure it? We will see an idea of academic freedom as a form of critical citizenship that is not limited to the life of a scholar but instead extends to the politics of the academy as a whole. More specifically, we will examine how, with the recent focus on the #MeToo movement, various forms of marginalization and oppression have been used to silence certain people and entire groups. We will also look into the difference between thinking about the academy and the power of the academy. The position of the academy as a platform for political and ideological activism, both on its own and within the broader Left movement, is becoming a more and more prominent part of recent activism. As such, these ideas will be explored within the context of the Left's continuing struggle against economic, gender, and other forms of oppression. This talk will explore this growing trend, and will use the example of the #MeToo movement to illustrate how progressive change is possible only when there is a clear understanding of the limits of academic freedom.Inositol 1,4,5-trisphosphate (IP3) binds to membranes containing lipids enriched in polyunsaturated fatty acids. The binding of IP3, a ligand of intracellular calcium release channels, to liposomes composed of phosphatidylcholine (PC), phosphatidylethanolamine (PE) and phosphatidylserine (PS) was studied. The binding of IP3 to PC liposomes was independent of calcium and did not depend on the composition of the bilayer. The binding of IP3 to PE/PS liposomes was dependent on the presence of calcium and was sensitive to calcium in the range 10(-8) M to 10(-6) M. The binding of IP3 was dependent on the presence of long-chain polyunsaturated fatty acids in the a1d647c40b
